EDUCATION

San Jose State University | San Jose, CA | *B.S. Computer Science*

Dec 2025

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, Java, SQL, HTML/CSS

Frameworks & Libraries: React, React Native Web, Node.js, Express.js, Flask

Databases: PostgreSQL, MongoDB, Redis, SQLite, ChromaDB

Tools & Platforms: AWS, Cloudflare Workers, Docker, Git, Linux, WebSockets

EXPERIENCE

Software Engineer | *Prokuro AI*

Jan 2026 – Present

- Cut agent tool-call failures by a third (6% → 4%) by adding schema validation and automatic retries for malformed tool calls, reducing manual workflow reruns by 10%.
- Reduced LLM token usage by ~400 tokens per agent run (3%) by trimming redundant prompt context and caching repeated supplier lookups, cutting lookup calls by 15%.
- Reduced p95 latency of multi-step agent workflows by 0.4s by parallelizing independent tool calls and batching database reads, cutting DB round trips per run by 20%.

Full Stack Developer | *Abu Barista Coffee – Local Business Client*

Sep 2025 – Jan 2026

- Built and launched abu-barista-coffee.com, a 15-page TypeScript/React Native Web storefront backed by a 27-endpoint REST API for online ordering, event quotes, and order history, serving 35+ daily active users.
- Implemented account security with PBKDF2-SHA256 password hashing (100k iterations), 7-day JWT sessions, and HMAC-hashed email verification codes that expire after 15 minutes and lock after 5 failed attempts.
- Cut hosting costs from \$10/month to \$0 by migrating the backend from Express/SQLite to Cloudflare Workers + D1.
- Built an admin dashboard that lets the owner manage orders, quotes, and inventory without developer help.

PROJECTS

RateLimiter | *Python, pytest – Rate Limiting Library & HTTP Service*

Jun 2026 – Jul 2026

- Increased throughput 200× (~22 → ~4,700 req/s) on a single keep-alive connection by diagnosing a Nagle's algorithm/delayed-ACK stall and coalescing each response into one write with TCP_NODELAY.
- Implemented 4 interchangeable rate-limiting algorithms (fixed window, sliding log, sliding counter, token bucket) behind a common interface and benchmarked throughput, per-key memory, and accuracy across traffic patterns.
- Verified thread safety with 82 tests (8 threads contending on one key) that run in under 1s using a fake clock, and fixed a memory leak where idle-key sweeps never released memory by rebuilding the key store on each sweep.

Envlens | *Python – CLI for Detecting Environment Variable Drift*

Mar 2026 – May 2026

- Built a zero-dependency CLI that detects 5 classes of env-var drift (missing, undocumented, unfilled, unused, duplicate) in a single pass by comparing variables referenced in code against .env and .env.example.
- Supported Python, JS/TS, Ruby, and Go with file:line reporting, using AST parsing for Python to avoid false positives from comments and strings, and regex scanners for the other languages.
- Guaranteed secrets never reach logs or CI output, even for malformed multiline values, and shipped it CI-ready with exit codes, JSON output, and 177 unit tests.

LinkPulse | *Node.js, PostgreSQL, Redis, React – URL Shortener with Real-Time Analytics*

Jan 2025 – May 2025

- Achieved sub-10ms redirects and cut PostgreSQL read load by 60% by adding a Redis cache for hot short-link lookups, measured under simulated concurrent load.
- Built real-time click analytics (geographic distribution, referrers, time-series charts) with a WebSocket pipeline streaming events to a React dashboard.
- Kept redirects fast under heavy traffic by buffering click events in Redis and batch-writing them to PostgreSQL every 5 seconds, reducing database writes by ~90%.

LEADERSHIP & ACTIVITIES

Software Engineering Club Officer | *San Jose State University*

Aug 2023 – Dec 2025

- Organized 20+ technical workshops, tutorials, and events for a 1,000+ member software engineering club, and helped build the club website's front end.
